I have a K250-4 & I am trying to get a footswitch working for it. does anyone have any schematics for builing the four button / six pin box or the Wah looking type boost pedal?

Has anyone built either of these? Can you point me in the right direction of some parts to do so.

Any info would be great. Please don't just respond with "check in previous posts" Been there.

I can send you the schematic for the board to chassie interconnect harnesses which covers what you are asking about if you have a fax number or send me a self addressed stamped envelope.
