I was followed home yesterday by a K200A-4 with a 3x15 Altec cabinet. I bought the amp in "dead" condition as I took the owner at his word. When I got home I plugged it up and found it really does work but the pilot light was burned out. The amp sat dormant for a few years and popped and cracked for a few minutes then sounded better as it was played a bit. However, none of the effects are working which seemed a little odd. Does this point to any particular problem or are they separate problems? I know on this model all effects are available on one channel so I thought that might be a clue. Thanks! BC

It has been almost 10 years since I had an A-4 head. Does this head require the switch to turn on the effects? I have been living in the K200B world too long! BC

I took an alligator clip test lead and attached it to each pin and a chassis ground to test the effects....they all work. BC

BC:

Congrats on the new adoption!

I hope your amp still has the original wiring because, maybe now we will finally be able to answer the 200A-4 footswitch question.

Exactly which pins control which effect?

There are 4 pins in the xlr, and the case is used for the ground. Please let us know the pinout for the pedal.

Bill

Then pins are 1=Trem/Vib 2=SelBoost 3=Clipper 4=Reverb If the numbers are not visible on the plug or you have 50+ eyes the pins are numbered left to right as you face the back of the amp.

Thank you BC!

We finally have an answer.

Does anyone have the schematics for wiring the Kustom 250-4 Footswitch? Any info would be helpful.
