I really would like to find someone who has a footswitch available to sell. I just fixed up my early 70's K2504 with the trem, vibe, reverb, harmonic clipper & selective boost. I had a guy who was going to build one for me but he proved to be unreliable. any leads would be helpful.

Why not build one of your own?

It's really not that hard if you have basic soldering and mechanical skills.

The ones that I remember that came with your amp, were huge cast metal pedals with light up FX name panels. You could build something more basic.

I'm still pretty new to working on electronics, I can solder up guitars and read basic schematics, but I wouldn't know how to wire up this footswitch. I know each of the six pins controls an effect and the center is ground. But thats as far as my understanding of that works. I would be interested in learning more if you or anyone on here has some information to share, I'm all ears. Thanks!

Send me a note at djt@chartermi.net and I'll send you a schematic of the pedal.
