Hey guys just snagged a pair of cabinets on ebay for a song. The two 15's are gone, but the sirens are still in place and seller claims they work. So if I put in Delta's like my other cabinets have, will this work for my PA system that Stevem and I are building....lol? Guessing that maybe these were guitar cabinets?

They will work, but a little short in height to get the sound out over peoples heads unless your on a stage!

I would how ever put a good crossover in it and not just use the stock in line cap,

So these are shorter than my D-130's? What cross-over Hz do I need? Sorryguess your thinking this is a 2-15 cabinet.....its a 3-15 but one is the siren. The 2 -15's were taken out.

Sorry when you posted that 2-15s where gone I thought you meant one from each cabinet!

I left my crystal ball home today !

My fault for not clarifying what I had.....got too excited again I guess. What should the crossover Hz be please? I don't know anything about sirens other than I'm guessing its a high frequency horn. What were they rated at wattage wise? This is a guitar cabinet....correct? Crystal ball.....too funny!
