I play Bass and my first Kustom was a K100 piggie back with 2-12" s and it sounded great and would surly blow away a 2-12 Fender Bassman!

There are many good 12" Bass drivers that would work with the internal volume of that cabinet , but if your going to use a k100 head they want a 8 ohm load which means using 2 16 ohm drivers and that's where the hang up is as there are not many 12" 16 ohm drivers to pick from that will work for Bassi in that size cabinet!

My two picks would be the off the shelf Eminence Man-O-war driver in 16 ohms, or call Weber and have them put you together a Bass driver.

Well using a K200 head changes everything!

In that case I would use 2 Eminence Basslite S2012 drivers that are 8 ohms and will work well with the 2-12" size cab wired in parallel which will give the needed 4 ohm load on the head.

The only fly in the ointment is that two 8 ohm driver can not be wired into a 8 ohm load, so if you might run another cab then that will need to be drivien off of a separate power amp.
