Hi guys, I was recently gifted a K300-5 that a friend of mine was going to throw away. Seeing that as a sin, I rescued it, and set out to finding out what it needed to get back to running condition. I checked the DC output on the speaker jack, and it's about 70vdc.. definitely needed help. I took off the cover and saw the power board (PC 5021) was pretty neat up and burned up some components. Would anyone out there have an up close pic of this board, so I can see what was what before the blow up. Just hoping bc it will make my life a lot easier. Thanks all. Bill

70 volts sounds strange since the output stage runs on a plus and minus 39 volts.
Pm me your email address and I can take some shots of my 300s guts and send them to you.

Whatever you do don't hook it up to a speaker unless you want to blow it!
