I'm trying to repair my late father's Kustom 150-7 and the treble potentiometer is missing. I cannot find a schematic for it, and have hit dead ends trying to find a replacement part.
Any leads or info would be greatly appreciated!

The schematic for the amp is on this site in the technical section. You can find it by model, or by circuit board number.

Both channels use the same 100K pot for the treble control.

You can get this new pot from Antique electronics part number R-VC-MA100K.

This pot will need to be hardwired back onto the circuit board since it is not a board mount type , but does have the right size mounting hole and shaft.
