Hello, ever one, I'm new to the forum. I have read posts in the past and found them to be very helpful. I've got a k200b-1 amp that keeps burning out the same resistor R736 and transistor Q2, if I'm reading the schematic right. I'm just a novice when it comes to electronics. something has shorted and i don't know where to look. So I'm hoping someone would point me in the right direction.

What Transistor are you using to replace Q2.

Check yo see if r737 is open and if Q708 is good.
