We have a Kustom III Lead amp to use in the backline of our venue. There is no information about the the impedance anywhere on the back of the amp. It is a standalone amp, not the combo variant.

I have searched but did not find any info on the net. Does anyone have any idea?

Thank you in advance.

Welcome to the joint!

For that to output its full 125 Watts of rms it will want a 4 ohm load which it was designed for.

It will as any SS will run fine with a 8 ohm load, but only output some 78 watts of rms power.
